

Exercise 2a – Simple HTML Markup

Objective

- Build a homepage for a training company consisting of some of the tags we have discussed

Overview

The page you are about to create will become, in time, the home page for a training organisation.

Activity

1. To save on typing, we have provided some template text. From the starter folder for this exercise, open **index.html**, where you'll see content for our page, but none of the HTML we need to create a website.
2. Convert this file into an HTML page by editing it and adding `<html>`, `<head>`, `<title>`, `<body>` and tags as required. Refer back to your notes to check where these tags should go if you are unsure.
3. Check your work by opening the file in your chosen browser. The text has no line breaks in it.
4. Use the `<p>` and `</p>` tags to break up the text into paragraphs.
5. Reload the file in a browser to check your work again.
6. Use the `` and `` tags where appropriate to show **strong importance** and *stress emphasis*.
7. Use the `<h1>` and `<h2>` tags to specify top-level and second-level headings for the text in the main page.
8. Use the `<hr>` tag to split up sections of the document with horizontal lines and check your work with a browser.
