

Exercise 3 – Links

Objective

- Create textual hyperlinks in HTML to link multiple pages
- Use HTML anchors

Overview

We are going to add a second page to an existing “site” and link the two together using anchor tags.

Activity

1. Create a new page called `courses.html` in this exercise’s Starter directory. This will be a guide to courses available via our training provider.
2. In your `courses.html` document, create the appropriate sections you need for an html page. For content - copy the text from the `courses.txt` file in the Starter folder into your new HTML page.
3. Create a hyperlink, using the `<a>` tag, from the home page (`index.html`) to the courses page (`courses.html`).
4. Create a hyperlink in the other direction, to go back from the courses page to the home page.
5. Use a browser to check that these hyperlinks allow the user to move from one page to another by pointing and clicking.
6. Finally, add a link to the bottom of both pages, which allow the user to send an email to `sheldon.cooper@qa.com`.

Paragraph spacing

7. Instead of separating paragraphs with `<p>` and `</p>`, use `
` to insert a line break. What is the difference?
